What is VM ?

A *virtual machine* is a management model for a physical server machine so that it can run multiple operating systems at once.

Preparing VM

- Choose your server provider and register (you can use : Digitalocean, Linode, AWS, GCP or ext)
- Choose the OS what you want. Generally many use Ubuntu OS
- After installation finish you need to config root password
- Find your SSH ip adrees for access your VM from SSH panel (PuTTY or MobaXTerm)
- After login with SSH success you can run command **apt update**
- After that you need to set the timezone
  - Check timezone list : timedatectl list-timezones
  - Set timezone : timedatectl set-timezone 'Choose Country'
